AIM: write a program to implement flow control at data link layer using SLIDING WINDOW PROTOCOL. simulate the flow of frames from one node to another.

Program Code

```
import os
```

```
def create_frames(message):
```

```
    frames = []
```

```
    for i, char in enumerate(message):
```

```
        frames.append({'Frame-No': i, 'DATA': char})
```

```
    return frames
```

```
def sender(frames, window_size, start_frame):
```

```
    sent_frames = []
```

```
    for i in range(start_frame, len(frames),
```

```
                    window_size):
```

```
        window_frames = frames[i:i + window_size]
```

```
        print(f"Sent frames: {window_frames}")
```

```
    with open('Sender-Buffer.txt', 'w') as sender_file:
```

```
        for frame in window_frames:
```

```
            sender_file.write(f"{frame['Frame-No']} "
                               f"{frame['DATA']}\n")
```

```
    with open('Receiver-Buffer.txt', 'w') as receiver_file:
```

```
        for frame in window_frames:
```

```
            receiver_file.write(f"{frame['Frame-No']} "
                                 f"{frame['DATA']}\n")
```

```
    save_last_frame(window_frames[-1]['Frame-No'])
```

```
    input("Press Enter to run the receiver --")
```

```
    if not receiver():
```

```
        print("ACK received: Frame mismatch detected.")
```

```
    break
```

```
    return sent_frames
```

```
def receiver():
```

```
    with open('Sender-Buffer.txt', 'r') as sender_file:  
        sender_frames = [line.split()[0] for line in  
                           sender_file.readlines()]
```

```
    with open('Receiver-Buffer.txt', 'r') as receiver_file:  
        receiver_frames = [line.strip() for line in  
                             receiver_file.readlines()]
```

```
    if sender_frames != receiver_frames:  
        return False
```

```
    else:
```

```
        print("Frames received correctly, sending Ack")  
        return True
```

```
def save_last_frame(last_frame_no):
```

```
    with open('Last-Frame.txt', 'w') as f:  
        f.write(str(last_frame_no))
```

```
def load_last_frame():
```

```
    if os.path.exists('Last-Frame.txt'):  
        with open('Last-Frame.txt', 'r') as f:  
            content = f.read().strip()  
            if content.isdigit():  
                return int(content) + 1
```

```
    return 0
```

```
def main():
```

```
    window_size = int(input("Enter window size: "))  
    message = input("Enter text message: ")
```

```
    frames = create_frames(message)
```

```
    start_frame = load_last_frame()
```

```
    sender(frames, window_size, start_frame)
```

```
if __name__ == "__main__":
```

```
    main()
```

Output

Buffer window size : 4

Enter text message : rajalakshmi

Sent frames : [{ 'Frame-No' : 0, 'DATA' : 'r' },
{ 'Frame-No' : 1, 'DATA' : 'a' }, { 'Frame-No' : 2,
'DATA' : 'j' }, { 'Frame-No' : 3, 'DATA' : 'a' }]

Press Enter to run the receiver...

Frames received correctly, sending ACKs

Result

Thus, a program to implement flow control at data link layer using sliding window protocol has been written and successfully executed and the output is verified.
